

Hands-On

Hands-On ini digunakan pada kegiatan Microcredential Associate Data Scientist 2021

Tugas Mandiri Pertemuan 13

Pertemuan 13 (tigabelas) pada Microcredential Associate Data Scientist 2021 menyampaikan materi mengenai MMembangun Model 4 (Dasar ANN). silakan Anda kerjakan Latihan 1 s/d 10. Output yang anda lihat merupakan panduan yang dapat Anda ikuti dalam penulisan code :)

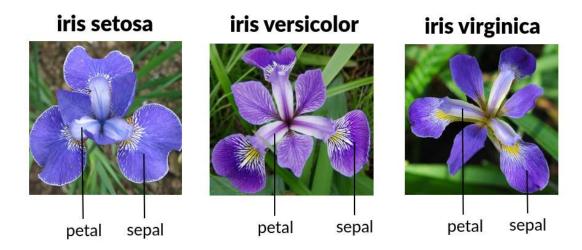

About Iris dataset

The iris dataset contains the following data (Before Cleansing)

- 50 samples of 3 different species of iris (150 samples total)
- Measurements: sepal length, sepal width, petal length, petal width
- The format for the data: (sepal length, sepal width, petal length, petal width)

The variables are:

- sepal length: Sepal length, in centimeters, used as input.
- sepal_width: Sepal width, in centimeters, used as input.
- petal_length: Petal length, in centimeters, used as input.
- petal width: Petal width, in centimeters, used as input.
- class: Iris Setosa, Versicolor, or Virginica, used as the target.

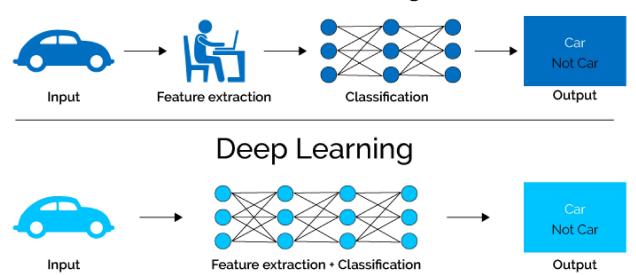

What is Deep Learning?

Deep Learning adalah subbidang machine learning yang berkaitan dengan algoritma yang terinspirasi oleh struktur dan fungsi otak yang disebut jaringan saraf tiruan / artificial neural networks (ANN). Deep learning adalah teknik machine learning yang mengajarkan komputer untuk melakukan apa yang terjadi secara alami pada manusia: belajar dengan memberi contoh. Deep learning adalah teknologi utama di balik mobil tanpa pengemudi, memungkinkan mereka mengenali tanda berhenti, atau membedakan pejalan kaki dari tiang lampu. Ini adalah kunci untuk kontrol suara di perangkat konsumen seperti ponsel, tablet, TV, dan speaker handsfree.

What are artificial neural networks?

artificial neuron network (ANN) adalah model komputasi berdasarkan struktur dan fungsi jaringan saraf biologis. Informasi yang mengalir melalui jaringan mempengaruhi struktur ANN karena jaringan saraf berubah - atau belajar, dalam arti tertentu - berdasarkan input dan output tersebut. ANN dianggap sebagai alat pemodelan data statistik nonlinier di mana hubungan kompleks antara input dan output dimodelkan atau pola ditemukan. ANN juga dikenal sebagai jaringan saraf / neural network.

Machine Learning

Latihan (1)

Melakukan import library yang dibutuhkan

```
In [1]: # import library pandas
import pandas as pd

# Import library numpy
import numpy as np

# Import library matplotlib dan seaborn untuk visualisasi
import seaborn as sns
import matplotlib.pyplot as plt
%matplotlib inline
plt.style.use('seaborn')

# me-non aktifkan peringatan pada python
import warnings
warnings.filterwarnings('ignore')
```

Latihan (2)

Review dataset

dataset yang digunakan merupakan Iris_AfterClean.csv dimana dataset ini sudah melewati proses cleansing sehingga tidak ada lagi outlier ataupun missing value!

In [2]: #Panggil file (load file bernama Iris_AfterClean.csv) dan simpan dalam dataframe
 df = pd.read_csv('Iris_AfterClean.csv')
 df.head()

Out[2]:

	SepalLengthCm	SepalWidthCm	PetalLengthCm	PetalWidthCm	Species
0	4.6	3.1	1.5	0.2	Iris-setosa
1	5.0	3.6	1.4	0.2	Iris-setosa
2	5.4	3.9	1.7	0.4	Iris-setosa
3	4.9	3.1	1.5	0.1	Iris-setosa
4	5.4	3.7	1.5	0.2	Iris-setosa

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 140 entries, 0 to 139
Data columns (total 5 columns):

#	Column	Non-Null Count	Dtype
0	SepalLengthCm	140 non-null	float64
1	SepalWidthCm	140 non-null	float64
2	PetalLengthCm	140 non-null	float64
3	PetalWidthCm	140 non-null	float64
4	Species	140 non-null	object

dtypes: float64(4), object(1)

memory usage: 5.6+ KB

In [4]: # melihat statistik data untuk data numeric seperti count, mean, standard deviati
df.describe()

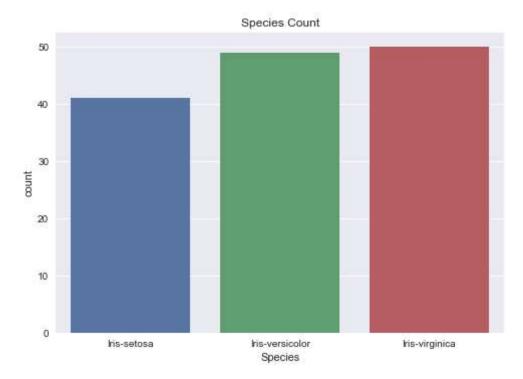

Out[4]:

	SepalLengthCm	SepalWidthCm	PetalLengthCm	PetalWidthCm
count	140.000000	140.000000	140.000000	140.000000
mean	5.902857	3.028571	3.910714	1.262857
std	0.819365	0.398791	1.720369	0.746825
min	4.300000	2.200000	1.000000	0.100000
25%	5.200000	2.800000	1.675000	0.400000
50%	5.850000	3.000000	4.500000	1.400000
75%	6.425000	3.300000	5.100000	1.800000
max	7.900000	4.000000	6.900000	2.500000

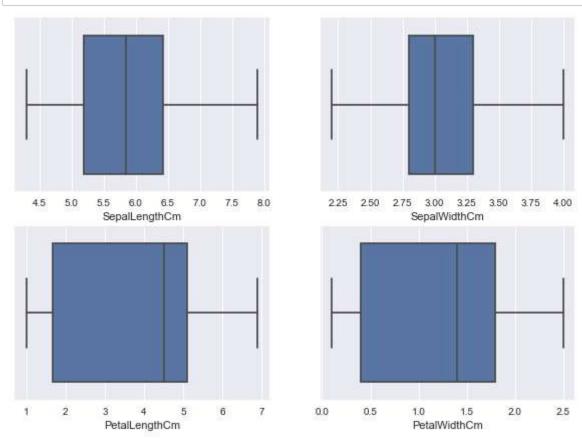

Latihan (3)

Exploratory Data Analysis (EDA)

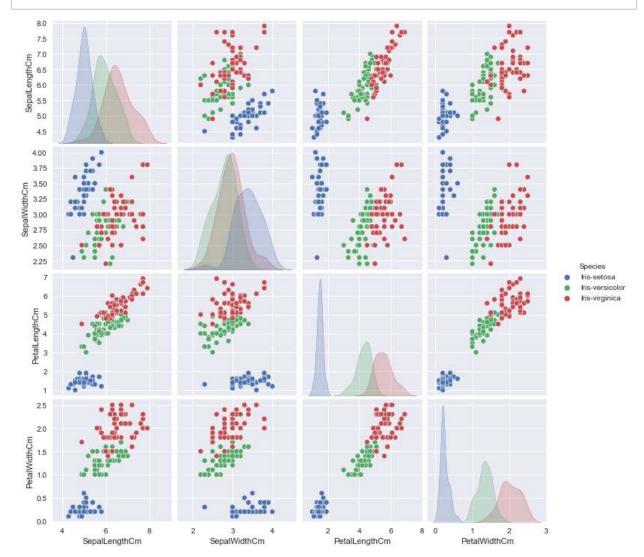

```
In [5]: # Melihat distribusi data dari target classes --> Species
plt.title('Species Count')
sns.countplot(df['Species'])
```

```
In [6]: # Plotting boxplots untuk memeriksa distribusi kolom numerik
    cols = df.columns[:-1].tolist()
    fig,ax = plt.subplots(2,2,figsize=(10,7))
    r = c = 0
    for col in cols:
        sns.boxplot(x=col, data=df,ax=ax[r,c])
        if c == 1:
        r+=1
        c = 0
        continue
    c+=1
```

In [7]: # visualisasikan kolom numerik yang dikelompokkan berdasarkan spesies
sns.pairplot(df,hue='Species')
pass

di bawah: [selengkapnya (https://www.kaggle.com/benhamner/python-data-visualizations)]

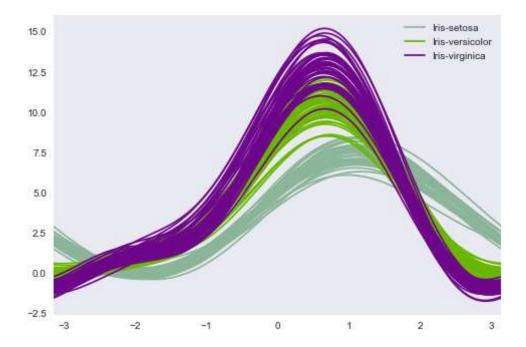

- Andrews Curves
- Parallel Coordinates

In [8]:

Satu teknik pandas yang lebih canggih dan keren telah tersedia disebut Andrews Cu Kurva Andrews melibatkan penggunaan atribut sampel sebagai koefisien untuk deret dan kemudian mem plotting ini

from pandas.plotting import andrews_curves pd.plotting.andrews_curves(df, "Species")

Out[8]: <AxesSubplot:>

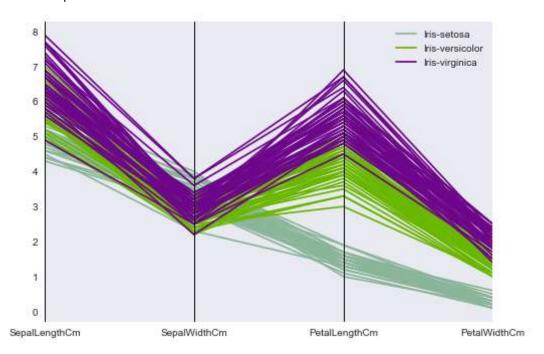

In [9]:

Teknik visualisasi multivariat lain yang dimiliki pandas adalah parallel_coordina Koordinat paralel memplot setiap fitur pada kolom terpisah & kemudian menggambar menghubungkan fitur untuk setiap sampel data

from pandas.plotting import parallel_coordinates
pd.plotting.parallel_coordinates(df, "Species")

Out[9]: <AxesSubplot:>

Data Preparation

Latihan (4)

a) Train-Test Split

```
In [10]: # definisi variabel X / data feature dan y / data targer (species):
    X = df.drop('Species',axis=1).values

# Karena ini adalah klasifikasi multikelas, label keluaran dikodekan satu kali ur
    y = pd.get_dummies(df['Species']).values

In [11]: # split data train dan test dengan function train_test_split() dengan train_size=
    from sklearn.model_selection import train_test_split

X_train, X_test, y_train, y_test = train_test_split(X,y,test_size=0.25,random_st
```

Latihan (5)

b) Feature Scaling

```
In [12]: # Performing min-max scaling
    from sklearn.preprocessing import MinMaxScaler

    scaler = MinMaxScaler()
    X_train_scaled = scaler.fit_transform(X_train)
    X_test_scaled = scaler.transform(X_test)
```

Model Creation/Evaluation

Latihan (6)

a) Creating model

```
In [13]: pip install tensorflow
```

(0.6.1)

```

Latihan (7)

b) Hyperparameter tuning

keras cls = KerasClassifier(build model)

Layaknya parameter, hyperparameter adalah variabel yang memengaruhi output model. Bedanya, nilai hyperparameter tidak diubah selama model dioptimisasi. Dengan kata lain, nilai hyperparameter tidak bergantung pada data dan selalu kita ambil as given saat pendefinisian model. Dua model dengan jenis yang sama namun hyperparameter berbeda bisa memiliki bentuk (i.e. memberikan output) yang berbeda pula.

```
In [19]: # import library EarlyStopping dan RandomizedSearchCV
from tensorflow.keras.callbacks import EarlyStopping
from sklearn.model_selection import RandomizedSearchCV
```

```
In [21]: | %%time
   model cv.fit(
    X_train_scaled, y_train, epochs=150,
    validation_data = (X_test_scaled,y_test),
    callbacks = [EarlyStopping(monitor='val_loss', mode='min', verbose=0, patient

Latihan (8)

c) Training the model

Latihan (9)

d) Plotting accuracy, loss of train and validation set

In [26]: pd.DataFrame(model.history.history).plot(figsize=(8, 5))
 plt.grid(True)
 plt.show()

Latihan (10)

e) Model evaluation

```
In [27]: from sklearn.metrics import classification_report,confusion_matrix

# Instead of probabilities it provides class labels
predict_x=model.predict(X_test)
classes_x=np.argmax(predict_x,axis=1)
```

Remarks:

Dalam hal ini hanya beberapa parameter yang dipertimbangkan untuk penyetelan hyperparameter. Untuk hasil yang lebih baik, kita dapat mempertimbangkan berbagai macam batch_sizes, epochs, dll.
